

Sales Performance Dashboard

Business Analytics Report

Tool: Tableau Public

1. Dashboard Overview

The Sales Performance Dashboard consolidates four key decision areas: overall business scale, monthly demand dynamics, product and category performance, and customer value. KPI cards provide an immediate view of total sales, orders, customers, and average order value, while the supporting charts explain the factors behind these results. The interactive Top N parameter also enables users to adjust the depth of customer analysis according to their business needs. Overall, the dashboard is designed to support regular executive monitoring and faster identification of areas requiring management attention.

Figure 1. Sales Performance Dashboard

2. Executive Summary

The business generated approximately \$1.737M in sales from 10,000 orders placed by 1,000 customers, with an average order value of \$174. An average of ten orders per customer indicates a meaningful level of repeat purchasing activity. Monthly revenue ranges from approximately \$130.7K in April to \$156.3K in January, without a sustained upward or downward trend, suggesting relatively stable demand. Category 2 generated approximately \$945K, representing about 54% of total revenue and outperforming Category 1 by nearly 20%. Products D and B jointly contributed approximately \$1.07M, or 62% of total sales, making them the main product-level revenue drivers. At the same time, the Top 5 customers account for only around 1.4% of total sales, indicating a diversified customer base rather than a critical dependency on a small number of buyers.

3. KPI Analysis

Total sales of \$1.737M demonstrate the overall scale of the business, but this figure should be interpreted together with order volume, customer count, and average order value. The average order value of \$174 shows how much revenue is generated from a typical transaction and provides a baseline for evaluating pricing, product mix, and cross-selling initiatives. With 10,000 orders from 1,000 customers, each customer placed approximately ten orders on average, indicating repeat purchasing behaviour rather than revenue driven solely by new customer acquisition. These metrics are important because revenue can grow through three different levers: acquiring more customers, increasing purchase frequency, or increasing the value of each order. Monitoring these indicators separately helps us identify which growth mechanism is improving or weakening. Future versions should also include KPI changes versus the previous period or target to make performance evaluation more actionable.

4. Trend Analysis

Monthly sales fluctuate within a relatively narrow range of approximately \$130.7K–\$156.3K, compared with an average monthly level of about \$144.8K. April represents the lowest point, while January records the highest sales value, but neither result develops into a sustained multi-month trend. Monthly order volume follows a broadly similar pattern, suggesting that changes in revenue are primarily associated with transaction volume rather than major changes in the value of individual orders. This relationship is important for operational planning because expected order volume directly affects inventory requirements, workload, and customer service capacity. The absence of major sales declines indicates stable underlying demand, but one year of data is insufficient to confirm whether the observed fluctuations represent true seasonality. A year-over-year comparison covering several periods would therefore provide a more reliable basis for forecasting and resource planning.

Figure 3. Monthly Orders and Sales Trend — comparison of transaction volume and revenue dynamics throughout the year

5. Product & Category Analysis

Category 2 generated approximately \$945K compared with about \$790K for Category 1, producing nearly 20% more revenue and contributing around 54% of total sales. This difference makes Category 2 a priority for deeper analysis of its product composition, customer demand, and profitability. Products D and B generated approximately \$543K and \$527K respectively and jointly account for about 62% of total revenue. Their strong contribution makes product availability, pricing, and promotional effectiveness important

business priorities, while also creating some dependence on two leading products. Product A generated the lowest revenue at approximately \$263K, but the visualization alone does not prove that it has growth potential; its demand, margin, distribution, and conversion performance should be investigated first. Adding units sold and gross margin would help determine whether the leading products are also the most profitable rather than simply the highest-volume products.

Figure 4. Product Revenue Contribution — Products D and B jointly generate approximately 62% of total sales

Figure 5. Sales by Category — Category 2 leads Category 1 and contributes approximately 54% of total revenue

6. Customer Analysis

The Top N Customers visualization dynamically ranks customers according to their total sales contribution and allows the user to adjust the number of customers displayed. The leading customer generated approximately \$6.1K, which is around 3.5 times higher than the average revenue per customer. However, the Top 5 customers jointly contributed only about \$24.7K, or approximately 1.4% of total revenue, indicating a relatively diversified customer portfolio and limited concentration risk. The chart is therefore useful primarily for identifying individual high-value customers rather than demonstrating that the business depends on a small VIP segment. These customers can be prioritized for personalized offers, loyalty initiatives, and proactive retention communication. Before assigning VIP status, sales

value should be supplemented with purchase frequency, recency, profitability, and customer lifetime value.

Figure 6. Top 5 Customers — highest-value customers ranked by total sales using an adjustable Top N parameter

7. Business Recommendations

- Analyse product profitability and gross margin.
- Investigate seasonal demand by product.
- Develop an executive dashboard with YoY comparison and forecasting.
- Monitor customer lifetime value (CLV).

8. Conclusion

The developed Sales Performance Dashboard provides a comprehensive overview of the company's sales performance by combining key performance indicators with interactive visual analytics. The dashboard enables decision-makers to quickly monitor business performance, identify high-value customers, evaluate product and category performance, and detect changes in sales trends over time.

The analysis indicates that the business maintains stable sales performance throughout the year, with no significant seasonal fluctuations. Category 2 contributes the largest share of total revenue, while Product D and Product B are the primary revenue drivers. The customer analysis also reveals that a relatively small group of customers generates a disproportionately high share of sales, highlighting the importance of customer retention and personalized marketing strategies.

From a business perspective, the dashboard supports data-driven decision-making by providing a single source of truth for monitoring operational performance. The implemented interactive features, including dynamic Top N customer analysis, KPI indicators, and trend visualizations, allow users to explore the data efficiently and identify opportunities for business improvement.

Although the current dashboard successfully addresses the primary analytical objectives, it can be further enhanced by incorporating additional business metrics such as gross profit, profit margin, customer lifetime value (CLV), customer segmentation (RFM analysis), year-over-year comparisons, and sales forecasting. These extensions would transform the dashboard from an operational monitoring tool into a more comprehensive strategic decision-support system.
